

ABSTRACT

A crate system for transport of items. The system includes a set of U shaped tubes that are mounted in an upright position on beams. A second set of U shaped tubes are also mounted in an upright position on beams. Each assembled set are then mounted on top of one another to form a crate system. The crate system can safely secure and even stack heavy items on top of one another. These crate systems can then be disassembled for packing and shipping back to the original shipper.
